

# Introduction to Computer Architecture

## CSE-3666

**Practice Final Exam**-- closed notes, closed book

Materials Allowed: Scrap paper, Calculator

Read problems carefully and budget your time wisely. Make your handwriting legible.

**Do not use pseudoinstructions in your answers.**

Question 1: ( 14 Points) \_\_\_\_\_

Question 2: ( 10 Points) \_\_\_\_\_

Question 3: ( 10 Points) \_\_\_\_\_

Question 4: ( 10 Points) \_\_\_\_\_

Question 5: ( 15 Points) \_\_\_\_\_

Question 6: ( 15 Points) \_\_\_\_\_

Question 7: ( 16 Points) \_\_\_\_\_

Question 8: ( 10 Points) \_\_\_\_\_

Total \_\_\_\_\_

I pledge my honor that I have not violated and will not violate the exam policy of this course and the Student Conduct Code during this examination.

**Signature:** \_\_\_\_\_

**Name:** \_\_\_\_\_

**PeoplesoftID:** \_\_\_\_\_

Note:

- **You need to show your work to get a full credit. you will receive partial credit if your final answers are not correct.**

1. (1) True or False.

- a. A pipelined datapath must have separate instruction memory and data memory since instruction format is different from data format.
- b. In the RISC-V 5-stage pipeline, not all RAW data hazards can be eliminated by forwarding.
- c. Pipelining reduces the latency of individual instructions.
- d. From generation to generation, the number of the cache blocks inside a CPU increases exponentially as Moore's law predicted.

(2) Select the correct answer(s) for the following questions. (One or multiple answers may be correct.)

a) How many memory addresses are there with a 32-bit address line?

- A.  $2^{32}$
- B. 32
- C.  $32^2$
- D. This depends on how much memory has been installed in the computer.

b) Which one of the following technology trend is NOT true:

- A. The CPU clock is running faster.
- B. The CPU performance keeps on improving.
- C. The CPU supply voltage is rising higher.
- D. The CPU power consumption is going up.

c) Given the Million Instructions per Second (MIPS) rate of a machine, we need \_\_\_\_\_ to calculate its average CPI.

- A. Clock frequency
- B. CPU Time
- C. Instruction count
- D. Both A and B

2. Short answers:

- a) Write the assembly language statement(s) that will reverse the values of each bit in register t0 and put the result in register s1.

b) What decimal number does the bit pattern  $0 \times 0C000000$  represent if it is a floating point number? Use the IEEE 754 standard.

c) Using three RISC-V instructions to multiply the value in  $S0$  by 10 and save the result in  $S1$ .

d) why do we need to save the instruction in a pipeline register multiple times?

e) Write two cache optimizations that are used to improve the miss rate.

3. A processor with a  $CPI_{ideal}$  of 2, a 100 cycle miss penalty, 36% load/store instr's, and 2% I cache and 4% D cache miss rates.

Suppose we add a unified L2 cache. L2 access time: 25 cycles, for both hit and miss  
Miss rate of the entire cache: 0.5%. What is the new  $CPI_{stalls}$ ? What is speedup?

4. Translate the lines of C code to RISC-V code that accomplishes the same thing.  
Assume  $a$  and  $b$  are stored in  $s0$  and  $s1$ , respectively. **Do not use pseudoinstructions in your**

**answers.**

```
Int a=5,b=10;
If (a+a==b){
    a=0;
}else{
    b=a-1;
}
```

5. Compilers can have a profound impact on the performance of an application. Assume that for a program, compiler A results in a dynamic instruction count of  $1.0E9$  and has an execution time of 1.1s, while compiler B results in a dynamic instruction count of  $1.2E9$  and an execution time of 1.5s.
  - a.) Find the average CPI for each program given that the processor has a clock cycle time of 1 ns.
  - b.) Assume the compiled programs run on two different processors. If the execution times on the two processors are the same, how much faster is the clock of the processor running compiler A's code versus the clock of the processor running compiler B's code?
6. 32 bit address of a direct-mapped data cache that has 6 bits for the offset field and 10 bits for the index field as shown below

31

15

5

0

10 bits

6 bits

(a) How many words per block does the cache have?

(b) How many bytes per block does the cache have?

(c) what is the data size of the cache in KB?

7. Consider the following sequence of instructions:

OR x5, x6, x7

OR x6, x5, x1

OR x5, x5, x6

Also, assume the following cycle times for each of the options related to forwarding:

Without Forwarding	With Full Forwarding	With ALU-ALU Forwarding Only
250ps	300ps	290ps

(a) Assume there is no forwarding in this pipelined processor. Indicate hazards (what types of hazard on which register from which line).

(b) If the hardware has no hazard detection unit, the hazards have to be eliminated by adding *NOP* instructions explicitly into the instruction sequence. Modify the instruction sequence to eliminate hazard.

(c) If the hardware has full forwarding unit. Draw the pipeline execution diagram. Indicate data forwarding on the diagram. In each clock cycle, indicate the value of forward A and forward B signals.

(d) What is the total execution time of this instruction sequence with full forwarding? What is the speedup achieved by adding full forwarding?

8. A processor has a Miss Rate of 5% for both instruction cache and data cache and a Hit Time of 0.2 ns. Assume that main memory accesses take 40 ns and that memory accesses are 40% of all instructions. (use appropriate units to get full credit)
- a) Assuming that the hit time determines the cycle time for the processor, what is its respective clock rate?
  
  
  
  
  
  
  
  
  
  
  - b) What is the average memory access time for the processor?
  
  
  
  
  
  
  
  
  
  
  - c) If the processor has a CPI of 1 without any memory stalls, determine and state how much faster a processor would run with a perfect cache that never missed.
